

## Instructions for 'gransim3D-linux' on Linux

1. Download 'gransim3D-linux.tar'.
2. Untar it: **tar -xvf gransim3D-linux.tar**
3. Go to the directory created: **cd gransim3D-linux**
4. Run the model with default options: **./run-model**

There will be 3 windows, one with model controls and two showing the model simulation space, for a full 3D view and a horizontal 2D slice that can be adjusted in the control window Visualization tab's "Slice to draw" control.

Since these may be hidden by other windows, you can minimize other windows to reveal them.

See file README.txt for more information and how to run the model with different options.
